EXECUTIVE SUMMARY

The Peacock Hill project is located in the Los Coches area of Lakeside, near El Cajon, in San Diego County. The 5-acre parcel is on the north side of Business Route 8 (East Main Street/Old Highway 80), northeast of Los Coches Road and southwest of Lakeview Road, just southwest of Kay Jay Court. The applicant proposes to develop multiple-family residential housing units on the parcel. The subject property is bounded by light commercial use on the west, a mobile home park to the north, a church to the east, and Business Route 8 to the south.

The archaeological project consisted of a survey and testing program to assess the presence and significance of cultural resources that would be affected by development of the property. The original fieldwork was conducted in 2001. The report was updated in 2012 and 2015 to meet current County standards. Mary Robbins-Wade served as the project manager/project archaeologist. This report addresses the methods and results of the survey and testing program, as well as Native American consultation.

Two archaeological sites were addressed by the testing program for the Peacock Hill property. CA-SDI-15,975 is downslope from the house and landscaping and includes milling features (basins, slicks, and mortars) on three large boulders. CA-SDI-15,976 consists of several bedrock milling slicks on two boulders, located on a slope adjacent to fruit trees and ornamental plantings associated with the house built circa 1932. The testing program conducted in 2001 indicated there was a break of over 50 m between the two sites, so they were recorded as two separate resources. However, it was noted that the two sites are probably associated with one another, the break being the result of the distance between bedrock outcrops used for milling. During the fieldwork conducted in 2014, additional cultural material was noted on the surface between the two sites, so the site map and site record were updated to address them as a single resource.

The two sites generally lack research potential, based on the limited amount and variety of cultural material encountered. However, due to the presence of possible human remains and one piece of definitively human bone, CA-SDI-15,975/15,976 is a significant cultural resource under the California Environmental Quality Act and the County's Resource Protection Ordinance. Therefore, impacts would be significant.

Prior to any ground-disturbing work, including brushing/grubbing, a thorough surface survey surface will be completed, and all visible cultural material will be collected. Any possible human remains will be repatriated to the Viejas Band of Kumeyaay Indians. If Viejas does not wish to accept the possible human remains, they will be reburied on-site in a location that will not be subject to future disturbance. Controlled grading will be conducted within the area of CA-SDI-15,975/15,976 using a slope board or similar equipment in order to allow soil to be removed in increments of only a few inches at a time. Controlled grading will be monitored by an experienced archaeological monitor

and a Native American monitor. Both monitors will have the authority to temporarily halt grading in order to examine, collect, and document any cultural material.

Due to the potential for subsurface cultural resources, both historic and Native American, construction monitoring is recommended, as addressed under Management Considerations – Mitigation Measures and Design Considerations.

Native American representative Clint Linton recommended that the bedrock milling features be preserved to the extent feasible, possibly incorporated into the landscape design. Avoidance of these features is not feasible, but it may be possible to split and move portions of the rocks on which the milling elements at CA-SDI-15,796 are located. This does not appear to be possible at CA-SDI-15,795, but these boulders would be covered with fill soils under the current project design and thus would be preserved, although they would no longer be visible.

1.0 INTRODUCTION

1.1 Project Description

The project area is located in the Los Coches area of Lakeside, near El Cajon, in San Diego County (Figure 1). The 4.83-acre parcel is on the north side of Business Route 8 (East Main Street/Old Highway 80/Highway 8 Business Route), northeast of Los Coches Road and southwest of Lakeview Road, just southwest of Kay Jay Court (Figures 2 and 3). The tiny Spanish land grant Cañada de Los Coches (entirely surrounded by the large land grant, Rancho El Cajon) is located about 500 ft. to the west, and Los Coches Creek is located almost immediately south of the project site (Figure 2). The parcel is in an unsectioned area of Township 15 South, Range 1 East, on the USGS 7.5' El Cajon quadrangle (Figure 2).

The applicant is proposing to develop multiple-family residential housing, including 64 units in 5 buildings on the 4.83-acre Peacock Hill parcel, as illustrated in Figure 3. The development includes private recreational facilities and solar photovoltaic and energy conservation features. The subject property is bounded by light commercial use on the west, a mobile home park to the north, a church to the east, and Business Route 8 to the south.

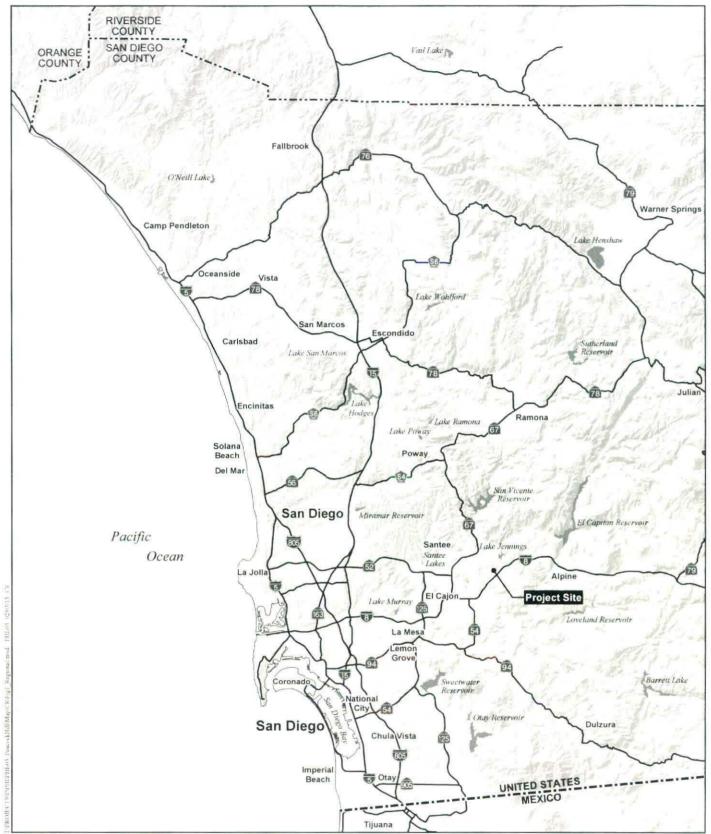

The archaeological project consisted of a survey and testing program to assess the presence and significance of cultural resources that would be affected by development of the property. The original fieldwork was conducted in 2001. The report was updated in 2012 and 2015 to meet current County standards. Subsequent site visits and additional fieldwork were conducted in 2014, as described in this report. Mary Robbins-Wade served as the project manager/ project archaeologist. This report addresses the methods and results of the original survey and testing program, the additional work conducted in 2014, and the report update. The vast majority of the work was conducted by Affinis. In September 2014, the Cultural Resources Division of Affinis moved to HELIX Environmental Planning. So, any work after September 1, 2014 was conducted by the same personnel but under HELIX, rather than Affinis.

1.2 Existing Conditions

1.2.1 Environmental Setting

Natural Environment

The project area is in the foothills of San Diego County, where the climate is characterized as Mediterranean hot summer. Average annual temperatures range from a low of about 40° F to a high of 80° to 90° F, and annual rainfall averages around 15 inches (Griner and Pryde 1976). Peacock Hill is almost immediately adjacent to Los Coches Creek, separated from the creek by the roadway (Business Route 8).

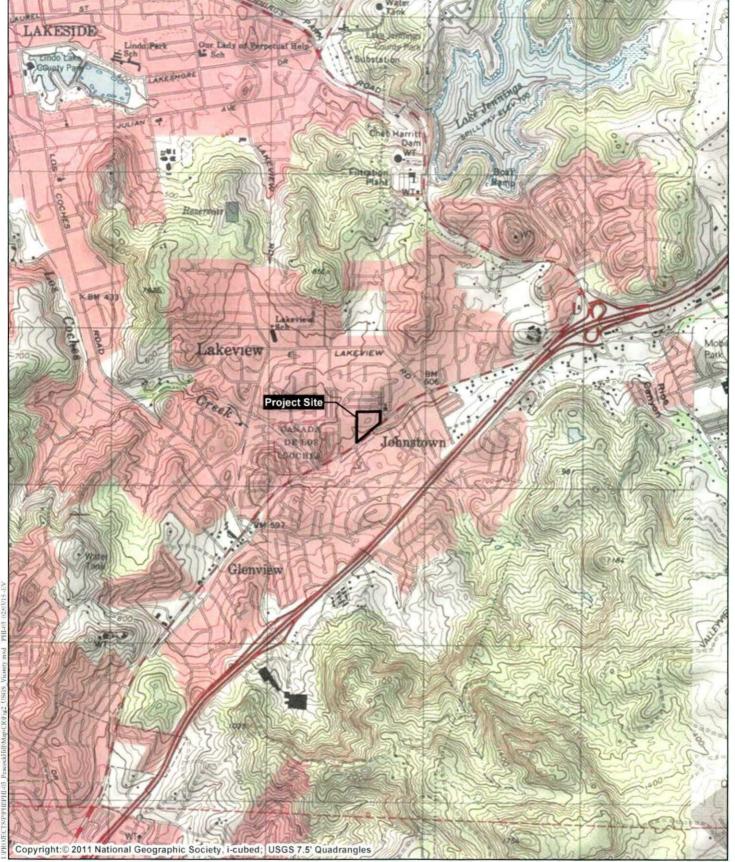

Regional Location

PEACOCK HILL

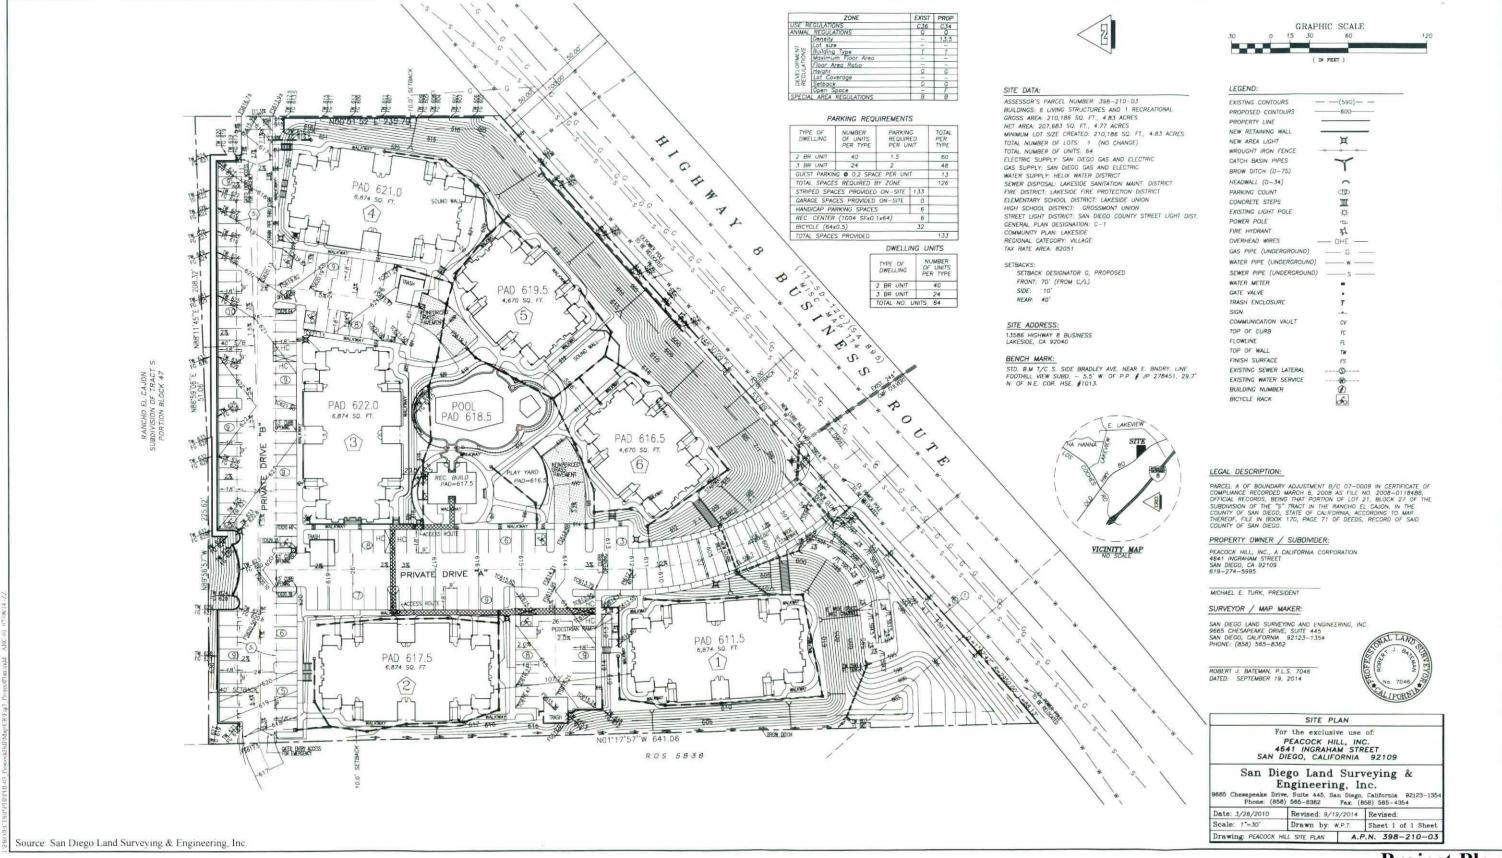

Project Vicinity Map

HELIX A 0

PEACOCK HILL

Project Plan

PEACOCK HILL

A short distance south of the property, Los Coches Creek makes a sharp turn and begins flowing in a northwesterly direction. Forester Creek is about 3.1 km (1.9 miles) south, and the San Diego River is located about 3.5 km (2.1 miles) to the north.

The property consists of a knolltop, on which a house stands, and the gentle slopes of the knoll (Figures 2 and 3). Elevation ranges only from a low of 588 ft. in the southwestern corner to 639 ft. on the knolltop. For the most part, the project area is underlain by Cretaceous granitic rock, mapped as granodiorite (Tan 2002). A small area along the southern project boundary is mapped as Holocene alluvium (Tan 2002). associated with Los Coches Creek. The U.S. Soil Conservation Service (Bowman 1973) maps the soils on-site as Fallbrook sandy loam, 9 to 15 percent slopes, eroded. This soil type consists of "sandy loams that formed in material weathered in place from granodiorite" (Bowman 1973:46). Vegetation supported by this soil type is typically "annual grasses, oak or broadleaf chaparral, and intermittent areas of chamise" (Bowman 1973:46). The chaparral and grassland communities include numerous plants known to have been used by native populations for food, medicine, tools, shelter, ceremonial and other uses (Christenson 1990; Hedges and Beresford 1986; Luomala 1978). Many of the animal species found in these communities would have been used by native populations as well. Rabbits were an important food source, as were deer, numerous small mammals, and birds.

Cultural Environment

General Culture History

Several summaries discuss the prehistory of San Diego County and provide a background for understanding the archaeology of the general area surrounding the project. Moratto's (1984) review of the archaeology of California contains important discussions of Southern California, including the San Diego area, as does a relatively recent book by Neusius and Gross (2007). Bull (1983, 1987), Carrico (1987), Gallegos (1987), and Warren (1985, 1987) provide summaries of archaeological work and interpretations, and another paper (Arnold et al. 2004) discusses advances since 1984. The following is a brief discussion of the culture history of the San Diego region.

Carter (1957, 1978, 1980), Minshall (1976) and others (e.g., Childers 1974; Davis 1968, 1973) have long argued for the presence of Pleistocene humans in California, including the San Diego area. The sites identified as "early man" are all controversial. Carter and Minshall are best known for their discoveries at Texas Street and Buchanan Canyon. The material from these sites is generally considered nonartifactual, and the investigative methodology is often questioned (Moratto 1984).

The earliest accepted archaeological manifestation of Native Americans in the San Diego area is the San Dieguito complex, dating to approximately 10,000 years ago (Warren 1967). The San Dieguito complex was originally defined by Rogers (1939), and Warren published a clear synthesis of the complex in 1967. The material culture of the San Dieguito complex consists primarily of scrapers, scraper planes, choppers,

large blades, and large projectile points. Rogers considered crescentic stones to be characteristic of the San Dieguito complex as well. Tools and debitage made of fine-grained green metavolcanic material, locally known as felsite, were found at many sites that Rogers identified as San Dieguito. Often these artifacts were heavily patinated. Felsite tools, especially patinated felsite, came to be seen as an indicator of the San Dieguito complex. Until relatively recently, many archaeologists felt that the San Dieguito culture lacked milling technology and saw this as an important difference between the San Dieguito and La Jolla complexes. Sleeping circles, trail shrines, and rock alignments have also been associated with early San Dieguito sites. The San Dieguito complex is chronologically equivalent to other Paleoindian complexes across North America, and sites are sometimes called "Paleoindian" rather than "San Dieguito". San Dieguito material underlies La Jolla complex strata at the C. W. Harris site in San Dieguito Valley (Warren, ed. 1966).

The traditional view of San Diego prehistory has the San Dieguito complex followed by the La Jolla complex at least 7000 years ago, possibly as long as 9000 years ago (Rogers 1966). The La Jolla complex is part of the Encinitas tradition and equates with Wallace's (1955) Millingstone Horizon, also known as Early Archaic or Milling Archaic. The Encinitas tradition is generally "recognized by millingstone assemblages in shell middens, often near sloughs and lagoons" (Moratto 1984:147). "Crude" cobble tools, especially choppers and scrapers, characterize the La Jolla complex (Moriarty 1966). Basin metates, manos, discoidals, a small number of Pinto series and Elko series points, and flexed burials are also characteristic.

Warren et al. (1961) proposed that the La Jolla complex developed with the arrival of a desert people on the coast who quickly adapted to their new environment. Moriarty (1966) and Kaldenberg (1976) have suggested an in situ development of the La Jolla people from the San Dieguito. Moriarty has since proposed a Pleistocene migration of an ancestral stage of the La Jolla people to the San Diego coast. He suggested this Pre-La Jolla complex is represented at Texas Street, Buchanan Canyon, and the Brown site (Moriarty 1987).

Since the 1980s, archaeologists in the region have begun to question the traditional definition of San Dieguito people simply as makers of finely crafted felsite projectile points, domed scrapers, and discoidal cores, who lacked milling technology. The traditional defining criteria for La Jolla sites (manos, metates, "crude" cobble tools, and reliance on lagoonal resources) have also been questioned (Bull 1987; Cárdenas and Robbins-Wade 1985; Robbins-Wade 1986). There is speculation that differences between artifact assemblages of "San Dieguito" and "La Jolla" sites reflect functional differences rather than temporal or cultural variability (Bull 1987; Gallegos 1987). Gallegos (1987) has proposed that the San Dieguito, La Jolla, and Pauma complexes are manifestations of the same culture, with differing site types "explained by site location, resources exploited, influence, innovation and adaptation to a rich coastal region over a long period of time" (Gallegos 1987:30). The classic "La Jolla" assemblage is one adapted to life on the coast and appears to continue through time

(Robbins-Wade 1986; Winterrowd and Cárdenas 1987). Inland sites adapted to hunting contain a different tool kit, regardless of temporal period (Cárdenas and Van Wormer 1984).

Several archaeologists in San Diego, however, do not subscribe to the Early Prehistoric/ Late Prehistoric chronology (see Cook 1985; Gross and Hildebrand 1998; Gross and Robbins-Wade 1989; Shackley 1988; Warren 1998). They feel that an apparent overlap among assemblages identified as "La Jolla," "Pauma," or "San Dieguito" does not preclude the existence of an Early Milling period culture in the San Diego region. separate from an earlier culture. One perceived problem is that many site reports in the San Diego region present conclusions based on interpretations of stratigraphic profiles from sites at which stratigraphy cannot validly be used to address chronology or changes through time. Archaeology emphasizes stratigraphy as a tool, but many of the sites known in the San Diego region are not in depositional situations. In contexts where natural sources of sediment or anthropogenic sources of debris to bury archaeological materials are lacking, other factors must be responsible for the subsurface occurrence of cultural materials. The subsurface deposits at numerous sites are the result of such agencies as rodent burrowing and insect activity. Recent work has emphasized the importance of bioturbative factors in producing the stratigraphic profiles observed at archaeological sites (see Gross 1992). Different classes of artifacts move through the soil in different ways (Bocek 1986; Erlandson 1984; Johnson 1989). creating vertical patterning (Johnson 1989) that is not culturally relevant. Many sites, which have been used to help define the culture sequence of the San Diego region, are the result of just such nondepositional stratigraphy.

The Late Prehistoric period is represented by the Cuyamaca complex in southern San Diego County and the San Luis Rey complex in the northern portion of the county. The Cuyamaca complex represents the Yuman forebears of the Kumeyaay (Diegueño, named for the San Diego Mission). The San Luis Rey complex is the archaeological manifestation of the Shoshonean predecessors of the ethnohistoric Luiseño (named for the San Luis Rey Mission). Agua Hedionda is traditionally considered to be the point of separation between Luiseño and Northern Diegueño territories.

Elements of the San Luis Rey complex include small, pressure-flaked projectile points (Cottonwood and Desert Side-notched series); milling implements, including mortars and pestles; Olivella shell beads; ceramic vessels; and pictographs (True et al. 1974). Of these elements, mortars and pestles, ceramics, and pictographs are not associated with earlier sites. True noted a greater number of quartz projectile points at San Luis Rey sites than at Cuyamaca complex sites, which he interpreted as a cultural preference for quartz (True 1966). He considered ceramics to be a late development among the Luiseño, probably learned from the Diegueño. The general mortuary pattern at San Luis Rey sites is ungathered cremations.

The Cuyamaca complex, reported by True (1970), is similar to the San Luis Rey complex, differing in the following points:

- Defined cemeteries away from living areas;
- Use of grave markers;
- Cremations placed in urns;
- Use of specially made mortuary offerings;
- 5. Cultural preference for side-notched points;
- 6. Substantial numbers of scrapers, scraper planes, etc., in contrast to small numbers of these implements in San Luis Rey sites;
- 7. Emphasis placed on use of ceramics; wide range of forms and several specialized items;
- Steatite industry;
- Substantially higher frequency of milling stone elements compared with San Luis Rey;
- 10. Clay-lined hearths (True 1970:53-54).

Both the Cuyamaca and San Luis Rey complexes were defined on the basis of village sites in the foothills and mountains. Coastal manifestations of both Luiseño and Kumeyaay differ from their inland counterparts. Fewer projectile points are found on the coast, and there tends to be a greater number of scrapers and scraper planes at coastal sites (Robbins-Wade 1986, 1988). Cobble-based tools, originally defined as "La Jolla", are characteristic of coastal sites of the Late Prehistoric period, as well (Cárdenas and Robbins-Wade 1985:117; Winterrowd and Cárdenas 1987:56).

While Juan Rodriguez Cabrillo visited San Diego briefly in 1542, the beginning of the historic period in the San Diego area is generally given as 1769. It was that year that the Royal Presidio and the first Mission San Diego were founded on a hill overlooking Mission Valley. The Mission San Diego de Alcala was constructed in its current location five years later. The Spanish Colonial period lasted until 1821 and was characterized by religious and military institutions bringing Spanish culture to the area and attempting to convert the Native American population to Christianity. Mission San Diego was the first mission founded in Southern California. Mission San Luis Rey, in Oceanside, was founded in 1798. Asistencias (chapels) were established at Santa Ysabel (1818) and Pala (1816).

The Mexican period lasted from 1821, when California became part of Mexico, to 1848, when Mexico ceded California to the United States under the treaty of Guadalupe Hidalgo at the end of the Mexican-American War. Following secularization of the missions in 1834, mission lands were given as large land grants to Mexican citizens as rewards for service to the Mexican government. The society made a transition from one dominated by the church and the military to a more civilian population, with people living on ranchos or in pueblos. The Pueblo of San Diego was established during the period, and transportation routes were expanded. Cattle ranching prevailed over agricultural activities.

The American period began in 1848, when California was ceded to the United States. The territory became a state in 1850. Terms of the Treaty of Guadalupe Hidalgo brought about the creation of the Lands Commission in response to the Homestead Act of 1851, which was adopted as a means of validating and settling land ownership claims throughout the state. Few of the large Mexican ranchos remained intact, due to legal costs and the difficulty of producing sufficient evidence to prove title claims. Much of the land that once constituted rancho holdings became available for settlement by immigrants to California. The influx of people to California and to the San Diego region resulted from several factors, including the discovery of gold in the state, the end of the Civil War, the availability of free land through passage of the Homestead Act, and later, the importance of San Diego County as an agricultural area supported by roads, irrigation systems, and connecting railways. During the late 19th and early 20th centuries, rural areas of San Diego County developed small agricultural communities centered on one-room schoolhouses. Such rural farming communities consisted of individuals and families tied together through geographical boundaries, a common schoolhouse, and a church, Farmers living in small rural communities were instrumental in the development of San Diego County. They fed the growing urban population and provided business for local markets. Rural farm school districts represented the most common type of community in the county from 1870 to 1930. The growth and decline of towns occurred in response to boom and bust cycles in the 1880s.

Los Coches Area

The project area is within the former Spanish land grant Rancho El Cajon, which included El Cajon, Lakeside, Santee, Fanita Ranch, Bostonia, Johnstown, Glenview, and parts of Grossmont (Lakeside Historical Society 1985). The 28-acre land grant, Cañada de Los Coches, which is entirely surrounded by Rancho El Cajon, is located about 500 ft. (150 m) west of Peacock Hill (Figure 2). A Kumeyaay village site is said to have been located in the area of this small land grant. This village is apparently represented by CA-SDI-143, located on Los Coches Creek, although little information is available about the site. A hill located about 2000 ft. (600 m) west of the current project area "was allegedly once the center of ceremonial activities for the area (Hedges, personal communication)" (Alter et al. 1992:13). "Indian shacks" existed at Los Coches when the land grant was given to Apolinaria Lorenzana in 1843 (Lakeside Historical Society 1985:6).

Cañada de Los Coches was apparently used to raise hogs for the Mission San Diego de Alcala. "In 1869 the El Cajon Rancho was sold and opened for settlement, in 1877, the land was fenced and no longer open to Los Coches stock. The days of the open range were over" (Lakeside Historical Society 1985:6).

1.2.2 Records Search Results

Records searches were obtained from the South Coastal Information Center and the San Diego Museum of Man for the project area and a one-mile radius around it as part of the original survey and testing program. The records search was updated in January

2012 (Confidential Appendix A). As summarized in Table 1, 18 archaeological sites, 3 isolated artifacts, and 3 historic buildings/building complexes have been recorded within a mile of the parcel. There is no site record for CA-SDI-142. Of the other 17 sites, 12 are milling stations, containing bedrock milling features and, in some cases, artifactual material. Three sites were described as lithic scatters, one site consists of two historic houses, and one is a historic trash deposit.

CA-SDI-143, which is located about 1250 ft. (380 m) west of the project, is described as follows: "Large boulder-cactus complex. Main part of site is on west side of creek". Bedrock mortars, mano fragments, pottery, thermal altered rock, and animal bone were noted. The site record indicated previous excavation by USD in 1971 and "being excavated summer 1972 by Jerry Lipetzky's high school class". This site probably corresponds to the "Indian shacks" noted at Cañada de Los Coches in 1843 and may represent a Kumeyaay village. Unfortunately, no report is available detailing any excavation at the site.

Table 1. Previously recorded sites within a one-mile radius

Site Number (CA-SDI-#)	Site Type	Site Dimensions	Site Recorder (Report Reference, when available)
142	No site record	-	Mrs. 7
143	Bedrock milling station, habitation debris	Not on record	Treganza no date; Lipetzky 1972
5046	Bedrock milling station	50 m by 200 m	A.C. Oetting 1979; Roth 1991
5799	Bedrock milling station	1 m by 1 m	D.M. Van Horn 1978; Strudwick, Rhodes, Rhodes 1993 (report – Gallegos 1993)
8231	Bedrock milling station	10 m by 10 m	Banks 1980
9774	Lithic scatter	65 m by 25 m	Cook 1983; Strudwick, Rhodes, Rhodes 1993 (report - Gallegos 1993)

Previous Studies

The SCIC has a record of 11 archaeological studies that have been conducted within a one-mile radius of the study area (Table 2). One of these studies is a negative survey. The others each resulted in recording between one and four resources.

Table 2. Previous studies within a one-mile radius

Report Name	Author, Year	Report Type	Results

Previous Recorded Sites Adjacent to the Study Area

There are no resources recorded adjacent to the project area.

1.3 Applicable Regulations

Resource importance is assigned to districts, sites, buildings, structures, and objects that possess exceptional value or quality illustrating or interpreting the heritage of San Diego County in history, architecture, archaeology, engineering, and culture. A number

of criteria are used in demonstrating resource importance. Specifically, criteria outlined in CEQA, RPO, and the San Diego County Local Register provide the guidance for making such a determination. The following sections detail the criteria that a resource must meet in order to be determined important.

1.3.1 California Environmental Quality Act (CEQA)

According to CEQA (§15064.5a), the term "historical resource" includes the following:

- (1) A resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources (Pub. Res. Code SS5024.1, Title 14 CCR. Section 4850 et seq.).
- (2) A resource included in a local register of historical resources, as defined in section 5020.1(k) of the Public Resources Code or identified as significant in an historical resource survey meeting the requirements of section 5024.1(g) of the Public Resources Code, shall be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.
- (3) Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be an historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the California Register of Historical Resources (Pub. Res. Code SS5024.1, Title 14, Section 4852) including the following:
 - (A) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
 - (B) Is associated with the lives of persons important in our past;
 - (C) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
 - (D) Has yielded, or may be likely to yield, information important in prehistory or history.
- (4) The fact that a resource is not listed in, or determined eligible for listing in the California Register of Historical Resources, not included in a local register of historical resources (pursuant to section 5020.1(k) of the Public Resources Code), or identified in an historical resources survey (meeting the criteria in section 5024.1(g) of the Public Resource Code) does not preclude a lead agency

from determining that the resource may be an historical resource as defined in Public Resources Code section 5020.1(j) or 5024.1.

According to CEQA (§15064.5b), a project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. CEQA defines a substantial adverse change as:

- (1) Substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.
- (2) The significance of an historical resource is materially impaired when a project:
 - (A) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources; or
 - (B) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
 - (C) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA.

Section 15064.5 8 of CEQA applies to effects on archaeological sites and contains the following additional provisions regarding archaeological sites:

- (1) When a project will impact an archaeological site, a lead agency shall first determine whether the site is an historical resource, as defined in subsection (a).
- (2) If a lead agency determines that the archaeological site is an historical resource, it shall refer to the provisions of Section 21084.1 of the Public Resources Code, and this section, Section 15126.4 of the Guidelines, and the limits contained in Section 21083.2 of the Public Resources Code do not apply.

- (3) If an archaeological site does not meet the criteria defined in subsection (a), but does meet the definition of a unique archaeological resource in Section 21083.2 of the Public Resources Code, the site shall be treated in accordance with the provisions of section 21083.2. The time and cost limitations described in Public Resources Code Section 21083.2 (c-f) do not apply to surveys and site evaluation activities intended to determine whether the project location contains unique archaeological resources.
- (4) If an archaeological resource is neither a unique archaeological nor an historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment. It shall be sufficient that both the resource and the effect on it are noted in the Initial Study or EIR, if one is prepared to address impacts on other resources, but they need not be considered further in the CEQA process.

Section 15064.5 (d) & (e) contain additional provisions regarding human remains. Regarding Native American human remains, paragraph (d) provides:

- (D) When an initial study identifies the existence of, or the probable likelihood, of Native American human remains within the project, a lead agency shall work with the appropriate Native Americans as identified by the Native American Heritage Commission as provided in Public Resources Code §5097.98. The applicant may develop an agreement for treating or disposing of, with appropriate dignity, the human remains and any items associated with Native American burials with the appropriate Native Americans as identified by the Native American Heritage Commission. Action implementing such an agreement is exempt from:
 - (1) The general prohibition on disinterring, disturbing, or removing human remains from any location other than a dedicated cemetery (Health and Safety Code Section 7050.5).
 - (2) The requirement of CEQA and the Coastal Act.

1.3.2 San Diego County Local Register of Historical Resources (Local Register)

The County requires that resource importance be assessed not only at the State level as required by CEQA, but at the local level as well. If a resource meets any one of the following criteria as outlined in the Local Register, it will be considered an important resource.

- Is associated with events that have made a significant contribution to the broad patterns of San Diego County's history and cultural heritage;
- Is associated with the lives of persons important to the history of San Diego County or its communities;

- (3) Embodies the distinctive characteristics of a type, period, San Diego County region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- (4) Has yielded, or may be likely to yield, information important in prehistory or history.

1.3.3 San Diego County Resource Protection Ordinance (RPO)

The County of San Diego's RPO protects significant cultural resources. The RPO defines "Significant Prehistoric or Historic Sites" as follows:

Sites that provide information regarding important scientific research questions about prehistoric or historic activities that have scientific, religious, or other ethnic value of local, regional, State, or Federal importance. Such locations shall include, but not be limited to:

- (1) Any prehistoric or historic district, site, interrelated collection of features or artifacts, building, structure, or object either:
 - (aa) Formally determined eligible or listed in the National Register of Historic Places by the keeper of the National Register; or
 - (bb) To which the Historic Resource ("H" Designator) Special Area Regulations have been applied; or
- (2) One-of-a-kind, locally unique, or regionally unique cultural resources which contain a significant volume and range of data and materials, and
- (3) Any location of past or current sacred religious or ceremonial observances which is either:
 - (aa) Protected under Public Law 95-341, the American Indian Religious Freedom Act or Public Resources Code Section 5097.9, such as burial(s), pictographs, petroglyphs, solstice observatory sites, sacred shrines, religious ground figures or
 - (bb) Other formally designated and recognized sites which are of ritual, ceremonial, or sacred value to any prehistoric or historic ethnic group.

The RPO does not allow non-exempt activities or uses damaging to significant prehistoric or historic lands on properties under County jurisdiction. The only exempt activity is scientific investigation. All discretionary projects are required to be in conformance with applicable County standards related to cultural resources, including the noted RPO criteria on prehistoric and historic sites. Non-compliance would result in a project that is inconsistent with County standards.

THIS PAGE INTENTIONALLY LEFT BLANK

2.0 GUIDELINES FOR DETERMINING IMPACT SIGNIFICANCE

For the purposes of this technical report, any of the following will be considered a potentially significant environmental impact to cultural resources:

- The project causes a substantial adverse change in the significance of a historical resource as defined in §15064.5 of the State CEQA Guidelines. This shall include the destruction, disturbance, or any alteration of characteristics or elements of a resource that cause it to be significant in a manner consistent with the Secretary of Interior Standards.
- The project causes a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5 of the State CEQA Guidelines. This shall include the destruction or disturbance of an important archaeological site or any portion of an important archaeological site that contains or has the potential to contain information important to history or prehistory.
- The project disturbs any human remains, including those interred outside of formal cemeteries.
- The project proposes activities or uses damaging to significant cultural resources as defined by the Resource Protection Ordinance and fails to preserve those resources.

The significance guidelines listed above have been selected for the following reasons:

Guidelines 1 and 2 are derived directly from CEQA. Sections 21083.2 of CEQA and 15064.5 of the State CEQA Guidelines recommend evaluating historical and archaeological resources to determine whether or not a proposed action would have a significant effect on unique historical or archaeological resources. Guideline 3 is included because human remains must be treated with dignity and respect and CEQA requires consultation with the "Most Likely Descendant" as identified by the Native American Heritage Commission (NAHC) for any project in which human remains have been identified.

Guideline 4 was selected because the RPO requires that cultural resources be considered when assessing environmental impacts. Any project that would have an adverse impact (direct, indirect, and cumulative) on significant cultural resources as defined by this Guideline would be considered a significant impact. The only exemption is scientific investigation.

All discretionary projects are required to be in conformance with applicable County standards related to cultural resources, including the noted RPO criteria on prehistoric and historic sites, as well as requirements listed in the Zoning Ordinance, General Plan,

and the Grading, Clearing and Watercourses Ordinance (§87.429). Non-compliance would result in a project that is inconsistent with County standards.

3.0 ANALYSIS OF PROJECT EFFECTS

3.1 Methods

3.1.1 Survey Methods

The project area was surveyed for cultural resources by Affinis personnel on March 15, 2001. The property was walked in parallel transects spaced a maximum of 10 m apart. In some areas, ground visibility was relatively poor, due to heavy grass cover or dense vegetation. Rodent back dirt piles were checked where they were found. In some areas, ground visibility was quite good.

Archaeological resources were mapped on the project topographic map, and site records were submitted to the South Coastal Information Center and the San Diego Museum of Man (Confidential Appendix B).

An historic architectural assessment of the existing house was conducted by Scott Moomjian. The house, which was built circa 1932, was determined not to be a significant historical resource.

At the request of representatives of the Viejas Band of Kumeyaay Indians, a resurvey of the project was conducted on August 12, 2014 by Andrew Giletti of Affinis and Viejas representatives Julie Hagen, Clarence Brown, Rene Curo, and DeAngelo Esponza. On December 5, 2014, the project area was again resurveyed by Andrew Giletti, Mary Robbins-Wade, and representatives of Viejas. During the December 2014 resurvey, the project site was walked in parallel transects; cultural material was flagged and GPS coordinates were obtained; locations of cultural material were then mapped on the project plan. This cultural material was not collected.

3.1.2 Testing Methods

Two archaeological sites were identified during the survey: CA-SDI-15,975 and CA-SDI-15,976. A testing program was conducted on March 26 through March 29, 2001, to determine the horizontal and vertical extent of the sites, document the bedrock milling features, and assess site significance. Due to the proximity of the two sites to one another, the testing program was also designed to determine whether they should be considered separate sites or a single resource (site maps are included in Confidential Appendix C).

The bedrock milling features were drawn and photographed, and standard bedrock milling feature forms were completed. These feature forms and drawings are included as Appendix A.

During the testing program conducted in 2001, all surface cultural material observed was flagged and was later mapped and collected. A series of shovel test pits (STPs)

was excavated across CA-SDI-15,975, extending to CA-SDI-15,976. Additional STPs were excavated around the milling features at CA-SDI-15,976. The STPs, which measured 50 cm north-south by 30 cm east-west, were oriented to true north and were excavated in 10-cm contour levels. The STPs were generally excavated to a depth of 50 cm, although two encountered bedrock before reaching this depth, and three were halted at 60 cm. STP 12 was excavated to 1 m. Two flakes were found in the 90-100 cm level, but it was not possible to excavate further in the small confines of an STP.

One test unit (1 m by 1 m) was excavated in proximity to STP 12, which went to 1 m in depth, and STP 2, which yielded flakes, Tizon Brown Ware, and animal bone. The area of Unit 1 was chosen because it seemed less disturbed than other areas and was relatively flat (not on the slope). Soils were passed through 1/8-in mesh rocker screens. Standard record forms were completed for each unit and level, recording artifact recovery, soil characteristics, and other information about the unit.

Archaeological resources were mapped on the project topographic map, and site records were submitted to the South Coastal Information Center and the San Diego Museum of Man (Confidential Appendix B).

At the request of the Viejas Band of Kumeyaay Indians, based on field visits and examination of bone fragments as described below, additional archaeological testing was conducted on August 22, 2014. The additional testing consisted of the excavation of seven STPs, using the same methods described above. STPs 1 and 2 were placed in proximity to the location where the possible human bone was identified during a field visit. STP 3 was located adjacent to and north of bedrock milling Feature 2, within the original site boundary of CA-SDI-15,976. STPs 4 -7 were located within the original boundary of CA-SDI-15,975.

3.1.3 Field Visits with Native American Representatives

In January 2012 a field check of the property and the archaeological sites was conducted by Affinis Field Director Andrew Giletti and Clint Linton of Red Tail Monitoring and Research (Native American representative).

A field visit with representatives of the Viejas Band of Kumeyaay Indians was conducted on July 28, 2014 by Andrew Giletti of Affinis and Viejas representatives Julie Hagen, Rene Curo, Ray Cuero (Tribal Councilman), and Ernest Pingleton. Viejas representatives requested a subsequent field visit with forensic anthropologist Dr. Madeleine Hinkes to examine fragments of burned bone noted on the July 28 site visit. Mary Robbins-Wade of Affinis was present for this field visit with Dr. Hinkes and Viejas representatives on July 31, 2014. As addressed above, resurveys of the project site were conducted with Viejas representatives on August 12, 2014 and December 5, 2014. A monitor from Viejas was present for testing conducted on August 22, 2014. A second field visit with Dr. Hinkes was conducted with Viejas representatives, as well as Andrew Giletti and Mary Robbins-Wade, on December 17, 2014.

3.1.4 Laboratory and Cataloging Procedures

All cultural material collected during the testing program (both 2001 and 2014) was taken to the Affinis lab, where it was cleaned, sorted, and cataloged. Standard catalog forms were completed for the collection that recorded provenience, artifact type, and material. The artifact catalogs are included as Appendix B of this report. All the bone collected during the 2001 fieldwork was examined by Dr. Madeleine Hinkes at the Affinis laboratory on August 6, 2014; her osteological reports are included as Confidential Appendix E.

3.1.5 Curation

Cultural material collected will be curated at the San Diego Archaeological Center or at a tribal curatorial facility that meets federal curation standards, as determined by agreement among the Native American monitor, the Principal Investigator, and County staff.

3.1.6 Native American Participation/Consultation

The Barona Band of Mission Indians was contacted in March 2001 in an effort to solicit any comments/concerns regarding development of the project area and include a Native American monitor in the fieldwork. No response was received from the Band.

In January 2012, the Native American Heritage Commission was contacted for a search of their Sacred Lands Files (see Confidential Appendix D). Individuals and groups identified by the Native American Heritage Commission were contacted regarding the project. Clint Linton of Red Tail Monitoring and Research conducted a field check of the sites with Affinis Field Director Andrew Giletti in January 2012.

In February 2012 the Viejas Band requested that Cultural Monitors from Viejas conduct a pedestrian survey. However, the request was received after the draft report had been submitted, and no further work was done on the project until 2014. At that time, Affinis contacted the Viejas Band to arrange a site visit. As described above and throughout this report, Affinis archaeologists worked with representatives from Viejas for three site visits (two with Dr. Madeleine Hinkes), two resurveys of the project area, additional testing, and examination of all the bone that had been collected during testing.

On November 24, 2014, a meeting was held at County Planning & Development Services offices to address concerns regarding development of the project and the presence of human remains within the project area. The meeting was attended by representatives of Viejas, the applicant's representative, the EIR preparer, County staff, and Mary Robbins-Wade.

3.2 Results

Two archaeological sites were recorded during the survey of the Peacock Hill property (Figure 4, Confidential Appendix C); the sites were tested in 2001 to assess site significance and the significance of project impacts. CA-SDI-15,975 is downslope from

SENS	SITIVE MATERIAL – IN CONFIDENTIAL APPENDIX C	
HELIX Environmental Planning 7578 El Cajon Boulevard La Mesa, CA 91942	Locations of Cultural Resources	Figure 4

the existing house and landscaping and includes milling features (basins, slicks, and mortars) on three large boulders. CA-SDI-15.976 consists of several bedrock milling slicks on two boulders, located on a slope adjacent to fruit trees and ornamental plantings associated with the house built circa 1932. The testing program conducted in 2001 indicated there was a break of over 50 m between the two sites, so they were recorded as two separate resources. However, it was noted that the two sites are probably associated with one another, the break being the result of the distance between bedrock outcrops used for milling. During the fieldwork conducted in 2014, additional cultural material was noted on the surface between the two sites, so the site map and site record were updated to address them as a single resource. However, only one artifact was found in a subsurface context between the two sites, and much of the surface material appears to have moved through slope wash, rodent activity, and general disturbance across the project site. In order to avoid confusion by renumbering all the milling features and artifacts from the work done in 2001, the sites are separately summarized in Table 3 and discussed individually below, with a discussion at the end of the section of the results of the worked conducted in 2014.

Table 3. Cultural resources within the Peacock Hill project area

CA-SDI-#	Site Description	Comments	Tested?	Significance Evaluation
15,975	Several bedrock milling elements (basins, slicks, and two mortars) on three large granitic boulders, debitage, cores, manos, and pottery. Possible human remains identified in 2014.	Originally recorded by Robbins-Wade, Giletti, Jannsen, LaFlam 2001	Yes	Significant, due to possible human remains
15,976	Several milling slicks on two granitic boulders, a mano fragment, several flakes, and historic debris. Possible human remains identified in 2014.	Originally recorded by Robbins-Wade, Giletti, Jannsen, LaFlam 2001	Yes	Significant, due to possible human remains

3.2.1 CA-SDI-15,975

CA-SDI-15,975 includes bedrock milling features, flaked stone and ground stone artifacts, and pottery covering an area of 60 m by 35 m. The site map is shown as Figure 5. This site includes three bedrock milling features with mortars, slicks, and basins. Details of the milling features are summarized in Table 4. Drawings of the features are included in Appendix A. Several of the milling elements were covered with dirt or leaf duff and were only visible once that layer of soil or leaves had been removed. Debitage, cores, manos, pottery (Tizon Brown Ware), and animal bone were found and collected (Table 5). One fragment of bone from Unit 1 was identified in 2014 as possibly human. A deposit of historic trash was found stashed in the rocks at Feature 2, and diagnostic artifacts from this trash deposit were collected (Table 5). During the 2014 testing program, four STPs were excavated within and adjacent to CA-SDI-15,975 (STPs 4-7), as addressed in section 3.2.4, CA-SDI-15,975/15,976 Additional Testing. The artifact catalog is included in Appendix B.

Table 4. CA-SDI-15,975, summary of bedrock milling features

Feature #	Milling Surface #	Туре	Length (cm)	Width (cm)	Depth (cm)	Remarks

^{*-} one fragment of bone was identified in 2014 as possibly human

As summarized in Table 5, there is little variety in the artifacts found at CA-SDI-15,975. Debitage is the most common artifact type, which is usual, as debitage is the byproduct of stone tool manufacture. Two cores were also collected. Eight manos and mano fragments were recovered, as were 18 sherds of Tizon Brown Ware. All of these items are consistent with our expectations for a Late Prehistoric milling station.

As summarized in Table 6, the majority of lithic artifacts are made from metavolcanic material. Medium- to coarse-grained metavolcanic material accounts for over 57 percent of the lithic material by count and 55 percent by weight, while fine-grained metavolcanics make up almost 15 percent of the lithic items by count and 4 percent by weight. Twelve quartz items (all debitage) account for almost 20 percent of the assemblage by count and 35 percent by weight. Two pieces of obsidian debitage were found, one from STP 5, 20-30 cm, and one from Unit 1, 10-20 cm. Unfortunately, both specimens were too small to be submitted for sourcing and hydration analysis.

Table 6. CA-SDI-15,975, summary of material types of flaked stone artifacts (2001)

Material	Count	Percent count	Weight (g)	Percent weight
Medium- to coarse-grained metavolcanic	35	57.4%	57.8	55.4%
Fine-grained metavolcanic	9	14.8%	4.6	4.4%
Quartzite	2	3.3%	4.1	3.9%
Quartz	12	19.7%	36.5	35.0%
Obsidian	2	3.3%	0.5	0.5%
Feldspar	1	1.6%	0.9	0.9%
TOTAL	61	100.0%	104.4	100.0%

Debitage attributes are summarized in Table 7. Almost 90 percent of the debitage has no cortex; only four items (6.8 percent) have cortex over more than 30 percent of the dorsal surface (Table 7). This indicates that primary tool reduction was not undertaken at the site; rather, tool finishing and maintenance occurred here. Half of the debitage shows no evidence of platform preparation, suggesting that tool manufacture may have been rather expedient; the tool- maker was not setting up a striking platform for maximum efficiency.

Two cores were recovered at CA-SDI-15,975, both from Unit 1 (30-40 cm and 40-50 cm). Both cores are of medium- to coarse-grained metavolcanic material. Both are whole and multidirectional.

Seven of the eight manos recovered are fragments. One mano is of quartzite, the other seven are medium- to coarse-grained metavolcanic. Four of the mano fragments are unifacial, and three are bifacial. The whole mano shows use on multiple faces. Only three of the manos are shaped, and four of them exhibit shouldering. Medium intensity of use is the most common classification (4 items). Two are categorized as heavy use, one shows light use, and one is too fragmentary to classify. The analysis is included in the artifact catalog in Appendix B.

A little over 25 g of animal bone was collected, all of it mammal bone, with the exception of one fragment that is undetermined (Table 8). The vast majority of the bone is "micro" or "small" mammal, much of which is probably not cultural. Ethnographic and archaeological sources indicate the importance of small mammals, such as rabbits, in the diet of the Kumeyaay people (see Christenson 1990; Luomala 1978), but these animals can also be incorporated into the archaeological record through natural death, rather than cultural use. Only two of the 58 small and micro mammal bones recovered exhibit burning. The "very large" mammal bone was found with historic debris stashed at Feature 2. One fragment of bone from Unit 1 was misidentified as medium mammal; it was identified by Dr. Hinkes in 2014 as possibly human (see Confidential Appendix E).

Table 8. CA-SDI-15,795, summary of animal bone recovered (all mammal)

Size class	Count	Percent count	Weight (g)	Percent weight	Burned brown (count)	Burned black (count)	Calcined (count)

TOTAL	72	100.0%	26.3	100.0%	1	7	0

As summarized in Table 5, 62 historic items were collected at CA-SDI-15,975, including glass (clear, brown, aqua, milk), ceramics (porcelain, earthenware, flow blue), miscellaneous metal, leather, and part of an electrical item. The vast majority of this material was found stashed in the rocks at Feature 2. A single bullet was found in STP 17, and eight fragments of clear glass were collected in Unit 1. The historic material is addressed in the Discussion section of the report.

3.2.2 CA-SDI-15,976

CA-SDI-15,976 consists of two bedrock milling features, one with six slicks and one with a single slick (Table 9), a few Native American artifacts, and historic trash (Table 10). Figure 6 is the site map. The artifact catalog is included in Appendix B. One additional STP was excavated at this site during the 2014 testing program; it was placed in proximity to the location of possible human bone. No cultural material was recovered in this STP, as addressed in section 3.2.4, CA-SDI-15,975/15,976 Additional Testing.

Only five pieces of debitage were found at CA-SDI-15,976: two from the 0-10 cm level of STP 9, one from the 0-10 cm level of STP 10, and two from the surface. Debitage attributes are summarized in Table 11. All the debitage is metavolcanic; three pieces are medium- to coarse-grained metavolcanic, and two are fine-grained.

Two manos were collected at CA-SDI-15,976. A whole bifacial mano was found on the boulder at Feature 2, and a unifacial mano fragment was collected in STP 9 (10-20 cm). Both manos are shaped and shouldered; neither exhibits battering or thermal alteration. Both manos are of medium- to coarse-grained metavolcanic material, and intensity of use is classified as medium.

Two Tizon Brown Ware sherds were collected, both from STP 10 (10-20 cm and 20-30 cm). Both pieces of pottery are body sherds.

About 20 g of animal bone were collected in the STPs at CA-SDI-15,976. All the bone collected was mammal. Medium-size mammal bone was the most frequent in terms of count. The two pieces of very large mammal bone account for half of the overall bone assemblage by weight. About half of the bone by count is burned. The bone assemblage is summarized in Table 12.

When the bone recovered in 2001 was examined by Dr. Hinkes in 2014, seven fragments from four proveniences at CA-SDI-15,976 were identified as possibly human. Three fragments, all burned to some degree, were from STP 9, 20-30 cm. Two fragments, one of which is burned brown, came from the 10-20 cm level of STP 10, and one (unburned) was from the 20-30 cm level of this STP. One fragment of long bone, unburned, was from STP 11, 10-20 cm (see Confidential Appendix E).

A single shell fragment (Pseudochama) was found, in the 10-20 cm level of STP 10.

Table 12. CA-SDI-15,976, summary of animal bone recovered

¹ – 2 fragments were identified in 2014 as possibly human

⁴ – 1 fragment were identified in 2014 as possibly human, not burned

3.2.3 CA-SDI-15,975/15,976 - Human Remains

As previously discussed, Dr. Madeleine Hinkes visited the site on July 31, 2014 to examine several bone fragments. In addition to three fragments at CA-SDI-15,976 identified by Dr. Hinkes as possibly human, one very weathered portion of a femur was found partially exposed between the two sites. Dr. Hinkes collected this bone for further examination in the lab and identified it as human; it is the only piece that was positively identified as human. Another fragment that had been noted at CA-SDI-15,976 was determined not to be human (see Confidential Appendix E).

Dr. Hinkes visited the site again on December 17, 2014 to examine bone fragments that had been noted and flagged on December 5, 2014. The locations of these pieces are shown in Figure 7. In all, 17 pieces of bone, some of them slivers or other tiny fragments, were identified as possibly human, and one was identified as likely human during the December 17, 2014 field visit. Other pieces of bone that had been flagged were noted as nonhuman (see Table 13). It is interesting to note that several pieces of large mammal bone, not human and showing butchering marks, were found in proximity to the femur and exhibited the same degree of weathering as that piece.

² – 1 fragment was identified in 2014 as possibly human

³ – 2 fragments were identified in 2014 as possibly human, one burned black, one not burned

Table 13. Bone Identification, December 2014

3.2.4 CA-SDI-15,975/15,976 - Additional Testing

During the 2014 site visits, a secondary deposit of artifacts and non-artifactual cobbles was noted near the block wall surrounding the house and yard (see Figures 4 and 7). The artifacts here were probably collected from across the property (and possibly other properties) and have no context. In addition, a displaced bedrock milling feature was observed; its location is also shown in Figures 4 and 7. This feature consists of a single slick on a rock that has been damaged by heavy equipment and moved from its original location, which is not known. The boulder has been moved such that the milling surface is now on the side of the rock, rather than the top (see Figure 8). Both the milling feature and the secondary artifact deposit are outside the boundaries of CA-SDI-15,975/15,976.

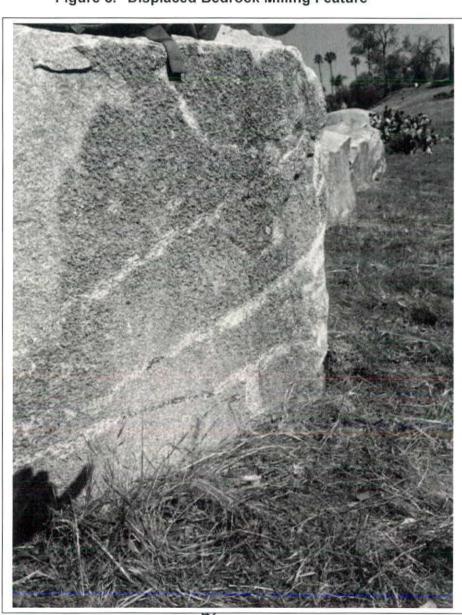

Figure 8. Displaced Bedrock Milling Feature

Seven STPs were excavated in the combined area of CA-SDI-15,975/15,976 in August 2014. STPs 1 and 2 were placed in proximity to the location of the one bone fragment positively identified as human. STP 3 was placed close to fragments of possible human bone identified during the earlier field visits. STP 3 was within CA-SDI-15,796; the other two STPs were placed between the mapped boundaries of the two sites. STPs 4-7 were located so as to further examine CA-SDI-15,795. The locations of the STPs are shown in Figures 4 and 7. Other cultural material, such as small pieces of debitage, pottery sherds, and shell fragments, was noted during the 2014 field visits. Much of this material was mapped, as shown in Figure 7, but none was collected.

Four of the seven STPs excavated in 2014 were sterile, including one in the area of CA-SDI-15,976 (STP 3), two within or adjacent to the mapped area of CA-SDI-15,975 (STPs 6 and 7), and one between the two sites, in proximity to the location of human bone (STP 2). Recovery from the STPs is summarized in Table 14.

Table 14. CA-SDI-15,975, Summary of Cultural Material Collected in Additional Testing (2014)

Class	Item	Count	Percent count	Weight (g)	Percent weight
Ground stone	Mano	1	12.5%	232.6	97.8%
Flaked stone	Debitage	7	87.5%	5.3	2.2%
TOTAL NATIVE AMERICAN		8	100.0%	237.9	100.0%
Bone/Antler	Bulk/unmodified	6	85.7%	1.1	45.8%
Shell	Bulk/unmodified	1	14.3%	1.3	54.2%
	TOTAL FAUNAL	7	100.0%	2.4	100.0%

STP 1, located in proximity to the location of a human femur, between the two sites as previously mapped, yielded two pieces of debitage: one from the 0-10 cm level, and one from the 10-20 cm level. STP 4, located in the northeastern portion of CA-SDI-15,975 (see Figures 4 and 7), produced 0.8 g of animal bone (four fragments). One of these fragments was obviously rodent bone. The other three were examined by Dr. Hinkes to ascertain that they were not possibly human; they were identified as animal. The remainder of the cultural material collected in August 2014 was from STP 5: one mano, five pieces of debitage, 1.3 g of shell, and 0.3 g of bone (rodent). The maximum depth at which cultural material was recovered in STP 5 was 30 cm.

The small amount of possible human bone, all of which consists of tiny fragments except the femur, could be from a single individual. There are no diagnostic elements. The limited amount of artifactual material indicates that CA-SDI-15,975/15,976 does not represent an intensively used habitation site. The general area has a number of

archaeological sites that taken together comprise a village area, but if the sites within the Peacock Hill project were at the heart of this occupation area we would expect to find a much greater amount of artifactual material than was recovered during both the 2001 and 2014 field efforts.

3.2.5 Historic Resources

The historic architectural study for the project indicated that the existing house was constructed around 1932 (Scott Moomjian, personal communication to Mary Robbins-Wade, 2001). A 1928 aerial photograph on file at the County of San Diego Cartographic Services shows improvements on the knolltop and slopes. It is plausible that the current house was built in the early 1930s and there was an older, perhaps more temporary, structure on the knolltop prior to that time.

The historic artifacts collected during the testing program were examined by Stephen R. Van Wormer and Susan Walter of Walter Enterprises. The material is generally indicative of the 1920s through the 1940s, although there is some modern trash, such as beer bottles. Some of the glass jars are canning jars, typical of the period of the 1920s through the 1940s. The piece of flow blue ceramic (from CA-SDI-15,975) appears to date to the nineteenth century. The porcelain pieces (from CA-SDI-15,975), including a small teapot, are Japanese. The large crock (from CA-SDI-15,975) is a butter crock.

Mr. Van Wormer and Ms. Walter recommend that an archaeologist be on-hand to monitor grading, as there may be subsurface features or trash deposits. Due to the small sample size of historic material, it is difficult to make much of a statement or draw conclusions regarding the site. However, it is possible that features or artifacts encountered during grading operations could add important information to our knowledge of the Los Coches area at the turn of the twentieth century.

3.2.6 Native American Participation/Consultation

The Barona Band of Mission Indians (now known as the Barona Group of the Capitan Grande) was contacted at the time of the original fieldwork in 2001. No comments were received from the Band.

The Native American Heritage Commission (NAHC) was contacted in January 2012 for a Sacred Lands File check. No Native American cultural resources were identified in the area. Letters regarding the project were sent to the contacts listed by the NAHC.

Clint Linton of Red Tail Monitoring and Research visited the project area with Andrew Giletti of Affinis in January 2012. Mr. Linton agreed that there appears to be little subsurface cultural material at the archaeological sites. However, he recommended that the bedrock milling features be preserved to the extent possible, due to the

importance of milling features to the Native American community. Mr. Linton also recommended monitoring during grading/ground-disturbing activity.

Due to physical limitations of the project site, it is not feasible to avoid impacts to the bedrock milling features. Moving the boulders on which the milling features are located is not feasible, due to the massive size of these outcrops. It may be possible to split the boulders at CA-SDI-15,976 such that the portion of the rocks containing the milling elements could be moved. This does not appear to be feasible for the features at CA-SDI-15,795, given the height of the boulders. The features at CA-SDI-15,795 are in an area that would be completely in fill and the boulders are not proposed to be removed, so these features would be preserved, but they would not be visible.

The Viejas Band of Kumeyaay Indians responded to the notification letter sent in 2012, but by the time the comment was received the report had been submitted, and the cultural resources study was on hold until 2014. As addressed throughout the report, beginning in July 2014, Affinis/HELIX archaeologists worked with Viejas tribal representatives to address concerns regarding human remains and the sensitivity of the project site. Several site visits were made, including two full resurveys of the property. Two site visits were made with Dr. Madeleine Hinkes to examine possible human bone; some bone was identified as possibly human, and other bone was identified as animal. One fragment of a femur was determined to be human. In addition, Dr. Hinkes examined all the bone collected during the 2001 testing effort; seven fragments from the testing program were found to be possibly human. The osteological reports are included as Confidential Appendix E.

In October 2014, Viejas requested that the project be moved and construction on the site be completely avoided, due to the presence of human remains and artifacts. The letter noted that Viejas has recorded the site with the NAHC. In November 2014, a meeting was held between Viejas representatives, County staff, the applicant's representative, the EIR preparer, and Mary Robbins-Wade to address this issue. As discussed in this meeting, complete avoidance of the site is not required; impacts to the resources can be mitigated. After no comments were received from Viejas between the December 17, 2014 field visit and July 2015, Ms. Robbins-Wade contacted Viejas asking for additional comments. A letter was received on July 22, 2015, indicating again that Viejas would like the project to be moved and construction on the site avoided. Public Resources Code Section 5097.98 states that if "the landowner or his or her authorized representative rejects the recommendation of the descendants and the mediation provided for in subdivision (k) of Section 5097.94, if invoked, fails to provide measures acceptable to the landowner, the landowner or his or her authorized representative shall reinter the human remains and items associated with Native American human remains with appropriate dignity on the property in a location not subject to further and future subsurface disturbance." County staff and the applicant havewill continued to work with the Tribe to address the respectful disposition of human remains and items of cultural patrimony. Viejas was contacted by the Project Archaeologist on December 24, 2015 via letter communication which included proposed

mitigation and the option for the Viejas to purchase the property. Viejas responded on January 15, 2016 with mitigation measures that they would like incorporated into the These measures include (1) a pre-survey prior to earth-disturbing activities – all visible cultural material will be collected with a Kumeyaay Cultural Monitor present; (2) repatriation of all possible human remains, ceremonial items, and items of cultural patrimony; (3) balance of artifacts to be curated at the San Diego Archaeological Center or appropriate tribal curation facility; (4) controlled grading shall be conducted within the area of CA-SDI-15975 and CA-15976 using a slope board or similar equipment so that soil will be removed in increments of only a few inches at a time; the controlled grading to be monitored by both an archaeological monitor and Kumeyaay cultural monitor; (5) include paid Kumeyaay cultural monitor trainees as part of the monitoring program; (6) relocate the onsite bedrock milling features to a landscaped area within the project site; and (7) provide a dedicated open space area in an area of the project site for repatriation; the open space would be gated to allow access to the Tribe but not the public and the location of the open space area shall not be close to the road to prevent vandalism. An open space area on the property provides a potential reburial location that would not be subject to future disturbance. Based on the request from Viejas, all requests have been incorporated into the project. The relocation of the bedrock milling will only be required if determined feasible.

4.0 INTERPRETATION OF RESOURCE IMPORTANCE AND IMPACT IDENTIFICATION

4.1 Resource Importance

4.1.1 Resource Importance - Archaeological and Native American Resources

The Peacock Hills sites, CA-SDI-15,975 and -15,976, are two small milling stations, probably associated with the larger habitation site that is purported to have existed in the area of Cañada de Los Coches. CA-SDI-15,975 and -15,976 probably actually represent a single site; they were treated as separate resources, because at the time of the 2001 fieldwork there was a break of 50 m between them, which appeared to be devoid of cultural material. Some surface artifacts were observed between the two sites in 2014, prompting a remapping of the two as a single resource. Only one artifact was found in a subsurface context between the two sites.

Although a significant amount of rodent activity has moved artifacts to a great subsurface depth in some areas (at least 1 m in STP 12), there is not a great deal of artifactual material at the sites, and there is very little variety in the assemblage. The presence of manos, as well as the bedrock milling features, is indicative of food processing activities. No other tools were found. There is a small amount of debitage and two cores, indicating some stone tool manufacture, primarily secondary reduction and tool maintenance. Late Prehistoric use of the site is indicated by Tizon Brown Ware sherds. This pottery could have been used for storage of acorns or grass seeds processed at the milling station, as well as for carrying water. Pottery is commonly found at food processing sites.

Two small obsidian flakes were recovered during the testing in 2001. Another small piece of obsidian was noted in 2014 but not collected. Unfortunately, the specimens were too small for hydration and sourcing analysis. The closest source of this volcanic glass is Obsidian Butte, near the Salton Sea. Other obsidian sources include several in Baja California, as well as the Coso Range, in central California. Determining the source of obsidian found in archaeological sites allows researchers to address questions about long distance trade or other forms of resource procurement. Obsidian hydration analysis serves as a relative dating method.

No organic material suitable for radiocarbon analysis was recovered. Although animal bone was collected, much of it appears not to be cultural (rodents who died on-site and were incorporated into the deposit) and some is historic. Given the vast amount of rodent disturbance that has moved material throughout the soil profile, it would be impossible to say with any confidence that any particular piece of bone was associated with a particular artifact or suite of artifacts, to give credence to any dating. The most we can say regarding period of site use is that the presence of mortars (used in acorn processing) and Tizon Brown Ware are indicative of the Late Prehistoric period.

A number of pieces of bone, most of them slivers or other tiny fragments, were identified as possibly human, and one piece was definitively identified as human. The bone is considered possibly human because the small pieces lack diagnostic features that would differentiate them as human or nonhuman. Therefore, given their context in an archaeological site, they must be considered to be possibly human.

The County's Guidelines for Determining Significance indicate that any site that yields information or has the potential to yield information is considered a significant site. Therefore, CA-SDI-15,795 and CA-SDI-15,796 are significant resources under County Guidelines. Due to the small amount of artifactual material found, these sites lack further research potential. Based on this, the sites would not be eligible for nomination to the California Register of Historical Resources under Criterion D; they do not represent "historic properties" under CEQA based on research potential. However, given the presence of human remains (or possible human remains), CA-SDI-15,975/15,976 is a significant resource under CEQA and the County's RPO.

4.1.2 Resource Importance - Historic Resources

The historic architectural study for the project determined the existing house was not a significant resource (Scott Moomjian, personal communication to Mary Robbins-Wade, 2001). Historic artifacts collected during the testing program at CA-SDI-15,795 and CA-SDI-15,796 are generally indicative of the 1920s through the 1940s, although there is some modern trash, such as beer bottles. This material does not represent a significant resource. However, there is a potential for subsurface historic features or trash deposits. It is possible that features or artifacts encountered during grading operations could add important information to our knowledge of the Los Coches area at the turn of the 20th century.

4.2 Impact identification

4.2.1 Impact Identification -- Archaeological and Native American Resources

Project impacts are summarized in Table 15. The significance of project impacts is assessed based on the County's Guidelines for Determining Impact Significance, as presented in Chapter 2.

Guideline 1: Not applicable to the archaeological and Native American resources.

Guideline 2: The project would cause a substantial change in the significance of an archaeological resource pursuant to Section 15064.5 of the State CEQA Guidelines. Two archaeological sites (CA-SDI-15,975 and CA-SDI-15, 976) have been identified within the Peacock Hill project area, both of which are within the proposed development footprint (Figure 7). As previously addressed, the Native American component of these sites generally lacks research potential. However, possible human remains and one piece of definitively human bone were identified at CA-SDI-15,795/15,796; therefore,

this is a significant cultural resource under CEQA, and mitigation measures are proposed as discussed in Chapter 5.0, Management Considerations – Mitigation Measures and Design Considerations.

Guideline 3: The project would potentially disturb human remains, including those interred outside of formal cemeteries. One piece of human bone and a number of fragments of potentially human bone have been identified; there is a potential for additional human remains to be present at the site.

Guideline 4: The project proposes activities or uses damaging to significant cultural resources as defined by the Resource Protection Ordinance. As addressed above, possible human remains have been identified at CA-SDI-15,795/15,796, making it a significant resource under CEQA. Mitigation measures have been proposed to mitigate impacts to below a level of significance.

Native American Concerns: Native American representative Clint Linton recommended that the bedrock milling features be preserved to the extent feasible, possibly incorporated into the landscape design. As previously addressed, avoidance of the features may not be feasible and is not a part of the current plan. However, the features at CA-SDI-15,975 will be covered with fill soils and will be preserved in this way.

Possible human remains have been identified at the site, prompting the Viejas Band of Kumeyaay Indians to recommend that the project not be developed. Some of the Viejas representatives suggested that the site is a village or that multiple burials may be encountered. As addressed throughout the report, the amount and variety of artifacts recovered was quite small, much less than what would be expected at a village site. With the exception of one piece, the possible human bone encountered is quite small and non-diagnostic; all of the bone observed could well be from a single individual. The applicant and County staff will continue to work with Viejas to ensure that any human remains and sensitive cultural material are treated in a respectful manner. Mitigation measures have been developed, but the project is not required to completely avoid the archaeological sites.

Table 15. Project Impacts

CA-SDI-#	Description	Significance Evaluation	Direct Impacts
15,975/15,976	Several bedrock milling elements (basins, slicks, and two mortars) on three large granitic boulders at CA-SDI-15,975 and two granitic boulder at CA-SI-15,976, debitage, cores, manos, pottery, shell, animal bone, and historic debris. Fragments of possible human bone.	Significant under CEQA and RPO, due to human remains, although the site lacks research potential.	Private Drive A; Buildings 1, 5, and 6; pool and play yard area; utilities; and associated cut/fill slopes

4.2.2 Impact Identification - Historic Resources

There is a potential for subsurface historic features or deposits, especially in the area of CA-SDI-15,976. Such features or artifacts, if encountered, could add important information to our knowledge of the Los Coches area at the turn of the twentieth century. Therefore, an archaeological monitoring program is recommended, as addressed under Management Considerations – Mitigation Measures and Design Considerations.

5.0 MANAGEMENT CONSIDERATIONS – MITIGATION MEASURES AND DESIGN CONSIDERATIONS

Two archaeological sites have been identified within the project area; both are within the proposed development footprint (Figure 7). Both sites were initially evaluated as not significant under CEQA, due to lack of research potential. However, CA-SDI-15,975/15,976 is considered a significant resource, due to the presence of possible human remains. The following measures must be implemented in order to mitigate impacts to below a level of significance.

Prior to any ground-disturbing work, including brushing/grubbing, a thorough surface survey surface will be completed, and all visible cultural material will be collected. Any possible human remains will be repatriated to the Viejas Band of Kumeyaay Indians as MLD. If any artifacts are considered to be items of cultural patrimony, these will be repatriated as well. Other artifacts collected will be curated at the San Diego Archaeological Center or appropriate tribal curatorial facility.

Controlled grading will be conducted within the area of CA-SDI-15,975/15,976 using a slope board or similar equipment in order to allow soil to be removed in increments of only a few inches at a time. Controlled grading will be monitored by an experienced archaeological monitor and a Native American monitor. Both monitors will have the authority to temporarily halt grading in order to examine, collect, and document any cultural material.

The archaeological consultant and Native American representatives will work with the grading contractor and project engineer to attempt to split the boulders at CA-SDI-15,796 in a controlled manner in order to move the portions of the rock on which bedrock milling features are located in order to preserve them in a landscaped area in the southwestern portion of the project site.

There is a potential for subsurface cultural resources, particularly in the alluvial soils in the southern portion of the project. Based on this, a monitoring program should be implemented for any grading or other-ground disturbing activity. Below are the monitoring conditions that must be included for project approval:

Pre-Construction

- <u>Pre-construction meeting to be attended by the Project Archaeologist, Kumeyaay Native American monitor(s), and up to three Kumeyaay Native American monitor trainee(s) to explain the monitoring requirements.</u>
- Pre-survey to be conducted prior to earth-disturbing activities by the Project Archaeologist, Kumeyaay Native American monitor(s), and up to three Kumeyaay Native American monitor trainees. All visible cultural material shall be collected and processed, as appropriate.
- A dedicated open space area shall be granted for the repatriation of human remains and cultural materials. The open space area shall be

permanently fenced and gated to allow access to the tribe but not to the public at large.

Construction

- Monitoring. The Project Archaeologist, Kumeyaay Native American monitor(s) and up to three Kumeyaay Native American monitor trainees are to be onsite during earth disturbing activities. The frequency and location of monitoring of native soils will be determined by the Project Archaeologist in consultation with the Kumeyaay Native American monitor(s).
- Controlled grading shall be conducted within the area of CA-SDI-15975 and CA-SDI-15976 using a slope board or similar equipment to allow soil to be removed in increments of only a few inches at a time.
- The onsite bedrock milling features shall be relocated to onsite landscaped areas, if feasible.

o If cultural resources are identified:

- Both the Project Archaeologist and Kumeyaay Native American monitor(s) have the authority to divert or temporarily halt ground disturbance operations in the area of the discovery.
- The Project Archaeologist shall contact the County Archaeologist.
- The Project Archaeologist in consultation with the County Archaeologist and Kumeyaay Native American shall determine the significance of discovered resources.
- Construction activities will be allowed to resume after the County Archaeologist has concurred with the significance evaluation.
- Isolates and non-significant deposits shall be minimally documented in the field. Should the isolates and non-significant deposits not be collected by the Project Archaeologist, the Kumeyaay Native American monitor(s) may collect the cultural material for transfer to a Tribal curation facility or repatriation program.
- If cultural resources are determined to be significant, a Research Design and Data Recovery Program shall be prepared by the Project Archaeologist in consultation with the Kumeyaay Native American monitor(s) and approved by the County Archaeologist. The program shall include reasonable efforts to preserve (avoid) unique cultural resources of Sacred Sites; the capping of identified Sacred Sites or unique cultural resources and placement of development over the cap if avoidance is infeasible; and data recovery for non-unique cultural resources. The preferred option is preservation (avoidance).

Human Remains.

The Property Owner or their representative shall contact the County Coroner and the PDS Staff Archaeologist.

- Upon identification of human remains, no further disturbance shall occur in the area of the find until the County Coroner has made the necessary findings as to origin.
- If the remains are determined to be of Native American origin, the Most Likely Descendant (MLD), as identified by the Native American Heritage Commission (NAHC), shall be contacted by the Property Owner or their representative in order to determine proper treatment and disposition of the remains.
- The immediate vicinity where the Native American human remains are located is not to be damaged or disturbed by further development activity until consultation with the MLD regarding their recommendations as required by Public Resources Code Section 5097.98 has been conducted.
- All possible human remains, ceremonial items, and items of cultural patrimony shall be repatriated to the Viejas Band of Mission Indians as the MLD.
- Public Resources Code §5097.98, CEQA §15064.5 and Health & Safety Code §7050.5 shall be followed in the event that human remains are discovered.

Rough Grading

Upon completion of Rough Grading, a monitoring report shall be prepared identifying whether resources were encountered. A copy of the monitoring report shall be provided to any culturally-affiliated tribe who requests a copy.

Final Grading

A final report shall be prepared substantiating that earth-disturbing activities are completed and whether cultural resources were encountered. A copy of the final report shall be submitted to the South Coastal Information Center and any culturally-affiliated tribe who requests a copy.

Disposition of Cultural Material.

- The final report shall include evidence that all possible human remains, ceremonial items, and items of cultural patrimony have been repatriated to the Viejas Band of Mission Indians as the MLD.
- The final report shall include evidence that all prehistoric materials (excluding human remains, ceremonial items, and items of cultural patrimony) have been curated at a San Diego curation facility or Tribal curation facility that meets federal standards per 36 CFR Part 79, or alternatively have been repatriated to a culturally affiliated tribe.
- The final report shall include evidence that all historic materials have been curated at a San Diego curation facility that meets federal standards per 36 CFR Part 79.

APPROVAL OF MAP: The conditions shall be complied with before a Final Map is approved by the Board of Supervisors and filed with the County Recorder of San Diego County and where specifically indicated, may be complied with on the Final map and shall also be complied with prior to approval of any plans, and issuance of any grading or other permits as specified:

CULT#1 ARCHAEOLOGICAL MONITORING [PDS, FEE X 2]

INTENT: In order to mitigate for potential impacts to undiscovered buried archaeological resources, an archaeological monitoring program and potential data recovery program shall be implemented pursuant to the County of San Diego Guidelines for Determining Significance for Cultural Resources and the California Environmental Quality Act (CEQA). DESCRIPTION OF REQUIREMENT: A County Approved Principal Investigator (PI) known as the "Project Archaeologist," shall be contracted to perform cultural resource monitoring and a potential data recovery program during all grading, clearing, grubbing, trenching, and construction activities. The archaeological monitoring program shall include the following:

- a. The Project Archaeologist shall perform the monitoring duties before, during and after construction pursuant to the most current version of the County of San Diego Guidelines for Determining Significance and Report Format and Requirements for Cultural Resources, and this permit. The contract or letter of acceptance provided to the County shall include an agreement that the archaeological monitoring will be completed, and a Memorandum of Understanding (MOU) between the Project Archaeologist and the County of San Diego shall be executed. The contract or letter acceptance shall include a cost estimate for the monitoring work and reporting.
- b. The Project Archeologist shall provide evidence that a Kumeyaay Native American has been contracted to perform Native American Monitoring for the project.
- c. The cost of the monitoring shall be added to the grading bonds or bonded separately.

Monitoring Contract or letter of acceptance, cost estimate, and MOU to the [PDS, PCC]. Additionally, the cost amount of the monitoring work shall be added to the grading bond cost estimate. TIMING: Prior to the approval of the map for PDS2015-TPM-21223 and prior to the approval of any plan and issuance of any permit, the contract or letter of acceptance shall be provided. MONITORING: The [PDS, PCC] shall review the contract or letter of acceptance, MOU and cost estimate or separate bonds for compliance with this condition. The cost estimate should be forwarded to [PDS, LDR], for inclusion in the grading bond cost estimate, and grading bonds and the grading monitoring requirement shall be made a condition of the issuance of the grading or construction permit.

Draft Grading Plan Notes:

PRE-CONSTRUCTION MEETING: (Prior to Preconstruction Meeting, and prior to any clearing, grubbing, trenching, grading, or any land disturbances.)

(CULTURAL RESOURCES)

CULT#GR-1 ARCHAEOLOGICAL MONITORING [PDS, FEE X2]

INTENT: In order to comply with the County of San Diego Guidelines for Significance – Cultural Resources, an Archaeological Monitoring Program shall be implemented. **DESCRIPTION OF REQUIREMENT:** The County approved Project Archaeologist, Kumeyaay Native American Monitor, and [PDS, PCC], shall attend the pre-construction meeting with the contractors to explain and coordinate the requirements of the archaeological monitoring program. The Project Archaeologist and the Kumeyaay Native American Monitor shall monitor the original cutting of previously undisturbed deposits in all areas identified for development including off-site improvements. The archaeological monitoring program shall comply with the County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements for Cultural Resources. DOCUMENTATION: The applicant shall have the contracted Project Archeologist and Kumeyaay Native American attend the preconstruction meeting to explain the monitoring requirements. TIMING: Prior to the Preconstruction Meeting, and prior to any clearing, grubbing, trenching, grading, or any land disturbances this condition shall be completed. MONITORING: The [DPW, PDCI] shall invite the [PDS, PCC] to the preconstruction conference to coordinate the Archaeological Monitoring requirements of this condition. The [PDS, PCC] shall attend the preconstruction conference and confirm the attendance of the approved Project Archaeologist.

DURING CONSTRUCTION: (The following actions shall occur throughout the duration of the grading construction).

(CULTURAL RESOURCES)

CULT#GR-2 ARCHAEOLOGICAL MONITORING [PDS, FEE X2]

INTENT: In order to comply with the County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements for Cultural Resources, a Cultural Resource Grading Monitoring Program shall be implemented. **DESCRIPTION OF REQUIREMENT:** The Project Archaeologist and Kumeyaay Native American Monitor shall monitor the original cutting of previously undisturbed deposits in all areas identified for development including off-site improvements. The archaeological monitoring program shall comply with the following requirements during earth-disturbing activities:

- a. During the original cutting of previously undisturbed deposits, the Project Archaeologist and Kumeyaay Native American Monitor shall be onsite as determined necessary by the Project Archaeologist. Inspections will vary based on the rate of excavation, the materials excavated, and the presence and abundance of artifacts and features. The frequency and location of inspections will be determined by the Project Archaeologist in consultation with the Kumeyaay Native American Monitor. Monitoring of cutting of previously disturbed deposits will be determined by the Project Archaeologist in consultation with the Kumeyaay Native American Monitor.
- b. In the event that previously unidentified potentially significant cultural resources are discovered, the Project Archaeologist or the Kumeyaay Native American monitor shall have the authority to divert or temporarily halt ground disturbance operations in the area of discovery to allow evaluation of potentially significant cultural resources. At the time of discovery, the Project Archaeologist shall contact the PDS Staff The Project Archaeologist, in consultation with the PDS Staff Archaeologist and the Kumeyaay Native American Monitor, shall determine the significance of the discovered resources. Construction activities will be allowed to resume in the affected area only after the PDS Staff Archaeologist has concurred with the evaluation. Isolates and clearly non-significant deposits shall be minimally documented in the field. Should the cultural materials for isolates and nonsignificant deposits not be collected by the Project Archaeologist, then the Kumeyaay Native American monitor may collect the cultural material for transfer to a Tribal Curation facility or repatriation program. A Research Design and Data Recovery Program to mitigate impacts to significant cultural resources shall be prepared by the Project Archaeologist in coordination with the Kumeyaay Native American Monitor. The County Archaeologist shall review and approve the Program, which shall be carried out using professional archaeological methods. The Research Design and Data Recovery Program shall include (1) reasonable efforts to preserve (avoidance) "unique" cultural resources or Sacred Sites; 3(2) the capping of identified Sacred Sites or unique cultural resources and placement of development over the cap, if avoidance is infeasible; and (3) data recovery for nonunique cultural resources.
- c. If any human remains are discovered, the Property Owner or their representative shall contact the County Coroner and the PDS Staff Archaeologist. identification of human remains, no further disturbance shall occur in the area of the find until the County Coroner has made the necessary findings as to origin. If the remains are determined to be of Native American origin, the Most Likely Descendant (MLD), as identified by the Native American Heritage Commission (NAHC), shall be contacted by the Property Owner or their representative in order to determine proper treatment and disposition of the remains. The immediate vicinity where the Native American human remains are located is not to be damaged or disturbed by further activity until consultation with the MLD regarding recommendations as required by Public Resources Code Section 5097.98 has been

conducted. Public Resources Code §5097.98, CEQA §15064.5 and Health & Safety Code §7050.5 shall be followed in the event that human remains are discovered.

d. The Project Archaeologist shall submit monthly status reports to the Director of Planning and Development Services starting from the date of the Notice to Proceed to termination of implementation of the grading monitoring program. The reports shall briefly summarize all activities during the period and the status of progress on overall plan implementation. Upon completion of the implementation phase, a final report shall be submitted describing the plan compliance procedures and site conditions before and after construction.

DOCUMENTATION: The applicant shall implement the archaeological monitoring program pursuant to this condition. **TIMING:** The following actions shall occur throughout the duration of the earth disturbing activities. **MONITORING:** The [DPW, PDCI] shall make sure that the Project Archeologist is on-site performing the monitoring duties of this condition. The [DPW, PDCI] shall contact the [PDS, PCC] if the Project Archeologist or applicant fails to comply with this condition.

ROUGH GRADING: (Prior to rough grading approval and issuance of any building permit).

(CULTURAL RESOURCES)

CULT#GR-3 ARCHAEOLOGICAL MONITORING [PDS, FEE]

INTENT: In order to comply with the County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements for Cultural Resources, an Archaeological Monitoring Program shall be implemented. **DESCRIPTION OF REQUIREMENT:** The Project Archaeologist shall prepare one of the following reports upon completion of the earth disturbing activities that require monitoring:

- a. If no archaeological resources are encountered during earth-disturbing activities, then submit a final Negative Monitoring Report substantiating that earth disturbing activities are completed and no cultural resources were encountered. Archaeological monitoring logs showing the date and time that the monitor was on site and any comments from the Kumeyaay Native American monitor must be included in the Negative Monitoring Report.
- b. If archaeological resources were encountered during the earth disturbing activities, the Project Archaeologist shall provide an Archaeological Monitoring Report stating that the field monitoring activities have been completed, and that resources have been encountered. The report shall detail all cultural artifacts and deposits discovered during monitoring and the anticipated time schedule for completion of the curation and/or repatriation phase of the monitoring.

DOCUMENTATION: The applicant shall submit the Archaeological Monitoring Report to the *[PDS, PCC]* for review and approval. Once approved, a final copy of the report shall be submitted to the South Coastal Information Center and the culturally-affiliated Tribe. **TIMING:** Upon completion of all earth disturbing activities, and prior to Rough Grading Final Inspection (Grading Ordinance SEC 87.421.a.2), the report shall be completed. **MONITORING:** The *[PDS, PCC]* shall review the report or field monitoring memo for compliance with the project MMRP, and inform *[DPW, PDCI]* that the requirement is completed.

FINAL GRADING RELEASE: (Prior to any occupancy, final grading release, or use of the premises in reliance of this permit). (CULTURAL RESOURCES)

CULT#GR-4 ARCHAEOLOGICAL MONITORING [PDS, FEE]

INTENT: In order to comply with the County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements for Cultural Resources, an Archaeological Monitoring Program shall be implemented. **DESCRIPTION OF REQUIREMENT:** The Project Archaeologist shall prepare a final report that documents the results, analysis, and conclusions of all phases of the Archaeological Monitoring Program if cultural resources were encountered during earth disturbing activities. The report shall include the following, if applicable:

- a. Department of Parks and Recreation Primary and Archaeological Site forms.
- b. Daily Monitoring Logs
- c. Evidence that all cultural materials have been curated that includes the following:
 - (1) Evidence that all prehistoric archaeological materials collected during the archaeological survey, testing and monitoring programs have been submitted to a San Diego curation facility or a culturally affiliated Native American Tribal curation facility that meets federal standards per 36 CFR Part 79, and, therefore. would professionally curated and made available archaeologists/researchers for further study. The collections and associated records, including title, shall be transferred to the San Diego curation facility or culturally affiliated Native American Tribal curation facility and shall be accompanied by payment of the fees necessary for permanent curation. Evidence shall be in the form of a letter from the curation facility stating that the prehistoric archaeological materials have been received and that all fees have been paid.

or

Evidence that all prehistoric materials collected during the grading monitoring program have been returned to a Native American group of appropriate tribal affinity. Evidence shall be in the form of a letter from the Native American tribe to whom the cultural resources have been repatriated identifying that the archaeological materials have been received.

- (2) Historic materials shall be curated at a San Diego curation facility and shall not be repatriated. The collections and associated records, including title, shall be transferred to the San Diego curation facility and shall be accompanied by payment of the fees necessary for permanent curation. Evidence shall be in the form of a letter from the curation facility stating that the historic materials have been received and that all fees have been paid.
- d. If no cultural resources are discovered, a Negative Monitoring Report must be submitted stating that the grading monitoring activities have been completed. Grading Monitoring Logs must be submitted with the negative monitoring report.

DOCUMENTATION: The applicant's archaeologist shall prepare the final report and submit it to the *[PDS, PCC]* for approval. Once approved, a final copy of the report shall be submitted to the South Coastal Information Center (SCIC) and the culturally-affiliated Tribe. **TIMING:** Prior to any occupancy, final grading release, or use of the premises in reliance of this permit, the final report shall be prepared. **MONITORING:** The *[PDS, PCC]* shall review the final report for compliance this condition and the report format guidelines. Upon acceptance of the report, *[PDS, PCC]* shall inform *[PDS, LDR]* and *[DPW, PDCI]*, that the requirement is complete and the bond amount can be relinquished. If the monitoring was bonded separately, then *[PDS, PCC]* shall inform *[PDS or DPW FISCAL]* to release the bond back to the applicant.

7.0 LIST OF PREPARERS AND PERSONS AND ORGANIZATIONS CONTACTED

The following persons participated in the preparation of this report:

Affinis/HELIX

Mary Robbins-Wade, M.A. (R.P.A.)

Director of Cultural Resources

Andrew Giletti, B.A. Field Director

Mark Janssen Archaeologist (2001)

Christa La Flam, M.A. Archaeologist (2001)

Stephen R. Van Wormer, M.A. Historic Archaeologist (2001)

Susan D. Walter, B.A. Historic Archaeologist (2001)

Red Tail Monitoring and Research

Clint Linton, B.A. Native American Representative

The following agencies and individuals were contacted:

Steve Banegas Kumeyaay Cultural Repatriation Committee

Frank Brown Inter-Tribal Cultural Resource Protection Committee

David Caterino South Coastal Information Center (2001)

Chairman Barona Band of Mission Indians

Ron Christman Kumeyaay Cultural Historic Committee

Leroy J. Elliott Manzanita Band of the Kumeyaay Nation

Michael Garcia Ewiiaapaayp Tribal Office

M. Louis Guassac Kumeyaay Diegueño Land Conservancy

Cheryl Jeffrey Barona Cultural Center and Museum

Monique LaChappa Campo Kumeyaay Nation

Allen E. Lawson San Pasqual Band of Mission Indians

Jaime Lennox South Coastal Information Center (2012)

Clint Linton Ipai Nation of Santa Ysabel

Carmen Lucas Kwaaymii Laguna Band of Mission Indians

Kenneth Meza Jamul Indian Village

Will Micklin Ewiiaapaayp Tribal Office

Andrea Najera Campo Band of Mission Indians

Rebecca Osuna Inaja Band of Mission Indians

Bernice Paipa Kumeyaay Cultural Repatriation Committee

Gwendolyn Parada La Posta Band of Mission Indians

Anthony R. Pico Viejas Band of Mission Indians

Edwin Romero Barona Group of the Capitan Grande

Mark Romero Mesa Grande Band of Mission Indians

Dave Singleton Native American Heritage Commission

Danny Tucker Sycuan Band of the Kumeyaay Nation

8.0 LIST OF MITIGATION MEASURES AND DESIGN CONSIDERATIONS

As addressed in Section 5.0, the following mitigation measures and design considerations will serve to mitigate project impacts to below a level of significance.

Table 16. Mitigation Measures and Design Considerations

CA-SDI-#	Direct Impacts	Mitigation Measures
15,795/ 15,796	Yes	Pre-survey, including collection of all surface cultural material prior to any ground-disturbing activity; controlled grading within the area of CA-SDI-15,795/15,796; relocation of bedrock milling features if feasible; controlled grading; monitoring of project grading; curation of any cultural material collected during survey, testing, and monitoring; repatriation of any possible human remains and items of cultural patrimony
